Read the passage and answer the following questions (13 - 14)

“The human brain processes information through a dynamic network of ~86 billion neurons, each forming thousands of synaptic connections. Unlike artificial neural networks (ANNs), biological neurons exhibit spiking behavior, where information is encoded in the timing and frequency of electrical pulses. This efficiency allows the brain to perform complex tasks like real-time decision-making with minimal energy—a stark contrast to the massive computational power required by ANNs to approximate similar functions”.

13. How do biological neurons primarily encode and transmit information, unlike artificial neural networks (ANNs)?
- A. Through continuous analog signals
 - B. Via binary (0 or 1) activation outputs
 - C. By storing fixed weights in synaptic connections
 - D. Using spiking behavior with timing and frequency of electrical pulses.
14. What is a key advantage of the human brain's neural processing compared to artificial neural networks (ANNs)?
- A. The brain requires massive external power sources for computation
 - B. The brain achieves complex tasks like real-time decision-making with minimal energy.
 - C. ANNs can process information faster due to parallel processing
 - D. ANNs have a higher number of neurons (over 100 billion) for better efficiency.
